TITLE: Short-Duration Pulse Generator

PERIODICAL: Pribery i tekhnika eksperimenta, 1960, No 3, pp 73-76

ABSTRACT: At present the most suitable industrial thyatron available for short pulse work is the TG11-3/1⁸ which breaks down in less than 5 ns with a variation in the instant of breakdown of less than 1 ns (see Refs 2-4). However it will only support about 1 kV at the anode and is thus suitable for low-voltage working only. The production of high-voltage pulses requires a subsequent amplifier. Fig 1 shows a suitable circuit in which the pulse driving the thyatron is formed in valves 6P14P and 6P13s. The output stages use GI-30 valves. The driving pulse is positive, 200 V and has a rise time of 20 ns. The pulse-forming line at the thyatron anode is a shorted length of RK-20 coaxial cable. A capacitance of 10-20 pF is found to be necessary at the

Short-Duration Pulse Generator

anode to improve the pulse shape. The cathode load of the thyatron is the input impedance of the length of terminated coaxial cable which connects the pulse to the final amplifier. This final driving pulse is positive, 300 V and has a rise time of 5 ns. The final amplifier offers alternative paths giving either polarity output. Each output valve is a parallel-connected double-tetrode. Valve L5 gives out a negative pulse whose rise and fall times will be less than 5 ns provided the load resistance is less than 200 ohms. Valve L4 gives a positive output and special precautions are necessary when driving this valve, as shown in Fig 2. In order to transmit a flat-topped pulse of given duration, the cable inductance must satisfy the condition at the foot of p 75. For short pulses the practical arrangement consists of 17 turns of RK-20 cable of adjustable pitch wound on a 40 mm diameter ceramic former containing a ferrite core. This produces

Chronicle. The VIII Session of the Commission for the
Determination of the Absolute Age of Geological Formations
(the section on the geologic-geographical sciences of the USSR)
(Department of Geological-geographical Sciences AS USSR),
May 18 - 22, 1959, Moscow

TITLE:

PERIODICAL:
ABSTRACT:

Geokhimiya, 1959, Nr 6, pp 562 - 563 (USSR)
The 8th regular session of the Commission on the Determination
of the Absolute Age of Geological Formations was held in Moscow
from May 18 to May 22, 1959 at the Institut geokhimiya i ana-
liticheskoy khimii im. V. I. Vernadskogo (Institute of Geo-
chemistry and Analytical Chemistry named V. I. Vernadsky).
A series of summarizing reports was held on age determinations
in the most important parts of the USSR, which are to be pre-
sented to the 21st International Geological Congress. The
reports are concerned:

1. The problems of the geochronology of the absolute age of
the Precambrian, 2. The geochronology of the absolute age
of the Ukrainian crystalline shield, 3. The absolute age
of the Caucasus, 4. The absolute age of the rocks of the Ukrainian
group of the mineralization of the rocks of the Ukrainian
their absolute age.

rocks of the (Soviet) Far East.
L. V. Kozlevi, Absolute age of the granite intrusions of
Kazakhstan.

The research work of a number of laboratories, ILM, GOKMI,
LIGED, VGOSEI, etc. is discussed. The research work of a number of laboratories, ILM, GOKMI,
LIGED, VGOSEI, etc. aroused great attention, especial-
ly a report of E. K. Gering, Yu. A. Shukolov on the con-
centration of the isotopes of uranium, thorium, and potassium
in the comprehensive laboratory work in uranium, thorium, and potassium
isotopes in the laboratory of the Institute of Geochemistry and Analytical
Chemistry of the Academy of Sciences of the USSR (Laboratory
of Age Determination of the Academy of Sciences of the USSR).
The determination of the absolute age of the rocks of the USSR
under the application of isotopic dilution and
fission track methods. The determination of the age of sedimentary
rocks was discussed. A. Ye. Krylov proved in his report how
well radiogenic argon is conserved in destroyed products of
rocks such as boulders, sands, sandstones, clays, and muds.
A. I. Makhov and S. I. Zhukov were the first to attempt to
determine the absolute age of sedimentary carbonate formations
according to isotopic composition of lead.

Card 3/4

PROBLEMS OF THE THEORY OF DISPERSION IN-
TERRELATIONSHIPS

N. N. Bogolyubov, D. V. Medvedev, M. K. Polivanov, and D. V. Sviridov, Institute of Nuclear Research, Laboratory of Theoretical Physics, Mar 1967, 1967, in Russian.

The field theory of particles is a theory of dispersion relations. The dispersion relations are used for separate matrix elements in the dispersion matrix. These relations are not associated with any degree of expansion but are based on the analysis of the analytical properties of matrix elements for the total S matrix as a unit. The analytic properties of the S matrix in local field theory, the spectral representation of the pion Green's function, the spectral representation of the fermion Green's function, the amplitude pion scattering in nucleons, the problems of analytical expansion of amplitude of scattering at $p \neq 0$, and the equations of dispersion for pion scattering in nucleons are discussed. (R.V.J.)

 Determination of small amounts of magnesium with radioactive phosphorus-32. N. I. Polevaya, N. N. Chernov, and S. I. Mirkina. *Vysokoe Nauch. Issledovanie. Geol. Inst., Informatsion. Sbornik* 1955, No. 1, 119-23. The detn. was conducted in a buffer soln. of 5 parts 2N NH₄Cl, and 2 parts 2.5% NH₃ by titration with a disodium phosphate soln. (I) contg. 0.2 mg./ml. of radioactive P³² (half-life 14.3 days, β -radiation 0.76-1.7 m.e.v.) the end point being detd. by the change in the radioactivity of the soln. The sensitivity was 0.5-2.5 mg., accuracy $\pm 1\%$. In a modified method Mg was pptd. with a 25% excess of I, and the radioactivity of the dissolved ppt. measured. Thus Mg was pptd. with a known amt. of I (contg. A mg. of P³² and having a total radioactivity B), filtered, washed with 2.5% NH₃, dissolved in HCl, and the radioactivity of dissolved ppt. detd.. The amt. of Mg was calcd.: Mg mg. = (0.785 Ab)/B, where 0.785 is the ratio of the at. wt. of Mg to the at. wt. of P. With the modified method 0.07 mg. of Mg can be detd. with an accuracy of 3-10%. *Cl. C.A. 35, 3921*.

Determination of small amounts of rubidium in the presence of potassium. N. I. Pólevina and S. L. Mirkin. *Trudy Gosnauk. Inst. Geol. Informats. Sbornik* 1955, No. 1, 123-5. To the aliquot part of the mixt. of Rb and K, $\text{Na}_2[\text{Co}(\text{NO}_2)_6]$ was added, and the total amt. of the elements was pptd. The ppt. was filtered after 15 hrs., washed with a soln. of 10 ml. EtOH and 1 ml. AcOH in 100 ml. H_2O , dried at 100° , and the wt. of the ppt. detd. (A). To the other aliquot part a known amt. of the radioactive Rb^{86} (half-life 19.5 days, β -radiation 1.82 m.e.v., γ -radiation 1.03 m.e.v.) was added, the elements were partially pptd., filtered, washed, dried, and the wt. of the ppt. detd. (a). The ppt. was dissolved in 5% HCl, and the radioactivity (1) of the soln. measured. The same was done with the 3rd aliquot part, to which the radioactive K^{42} (half-life 12.4 hrs., β -radiation 3.53 m.e.v., γ -radiation 1.81 m.e.v.) was added (the wt. of the ppt. was b). The ratio of 1 to the radioactivity of the initial soln. before pptn. was the coeff. of pptn. of Rb (a) and K (b), resp. The distribution of Rb and K in partially pptd. residues was in the same ratio as the coeffs. of pptn. The amts. of $\text{Rb}_2\text{Na}[\text{Co}(\text{NO}_2)_6] \cdot \text{H}_2\text{O}$ (c), and $\text{K}_2\text{Na}[\text{Co}(\text{NO}_2)_6] \cdot \text{H}_2\text{O}$ (y) were calcd. from the equations: $A = x + y$, and $(a(c + y)/2a)(x + \text{Rb}_2) + (b(c + y)/2b)(y + \text{K}_2) = (a + b)/2$, where Rb, and K, were equly. mts. of added radioactive Rb and K as cobaltinitrites. This method gave satisfactory results at ratios K:Rb = 109:1 and lower, the accuracy was within 5.5%.

✓ Absolute age of some magmatic rocks of the U.S.S.R. according to data of the argon method. N. I. Polevaya (All-Union Sci. Research Geol. Inst., Leningrad). *Izv. Akad. Nauk SSSR, Ser. Geol.* 1956, No. 5, 43-53. -- A report of the study of Mesozoic and Paleozoic magmatic rocks of the southern coastal area; Caledonide intrusion of the Ural S.S.R., and the Precambrian granitoids of the Ukraine. More than 300 detas. of abs. age of the intrusive and effusive rocks of different compn. and age were made. The A method was used. The A was liberated from the rock during its fusion, freed in an app. for gas microanalysis of all active gases and He, and measured volumetrically by means of a McLeod manometer. Accidental error of the expt. was ahd. at 2-5%, and only in the most unfavourable cases (e.g., young rocks with low K content) did it reach 10%. Systematic error of the A method caused by inaccuracy of the decomn. constn. is apparently small. The chief source of error was in the migration of K and A from the minerals under the influence of different superimposed processes widely prevalent in nature. Such errors can be detd. only with special app. and by much statistical data which P. also attempted to obtain in the present work. The K content in the samples was detd. by the dipicr flame method. AUTHORS: Kazakov, G. A., Polevaya, N. I. 307/7-50-4-2/13

TITLE: Some Preliminary Results From the Compilation of a Post-Precambrian Scale of the Absolute Geochronology According to Glauconites (Nekotoryye predvaritel'nyye dannyye po razrabotke posledokembriyskoy shkaly absolyutnoy geokhronologii po glaukonitam)

PERIODICAL: Geokhimiya, 1958, Nr 4, pp. 296 - 306 (USSR)

ABSTRACT: The paper is divided into four sections:

- 1) Short mineralogical and lithological characterisation of glauconites.
- 2) Method of separation of glauconite from the glauconite-containing sedimentary rocks. The operations carried out are compiled in a table in a clearly arranged manner.
- 3) Determination of the content of potassium and argon in glauconites. The emission of argon was investigated; the main amount escapes approximately at 300^o, the remainder in the dehydration (500 - 650^o). A table gives the results obtained by the analysis and the age computed from

Card 1/3

SOV/7-58-4-2/13

Some Preliminary Results From the Compilation of a Post-Precambrian Scale of the Absolute Geochronology According to Glauconites

them for the 22 investigated samples from the European part of the Soviet Union and Czechoslovakia.

- 4) The results of the argon method for the dated glauconites. All samples are accurately dated biostratigraphically. Geographical, stratigraphic, and paleontological data for the individual samples are compiled. The time scale of the geological ages which results herefrom is compared with the results obtained by other authors and with the scale according to Marble (Marbl). The time data agree well with those of Marble, except those for the Predevonian times which are too high.

Finally the further objects of research are discussed which result from the hitherto achieved results. The lithological-mineralogical working of the material was carried out in the Laboratory of Geochemistry of Sedimentary Rocks (Laboratoriya geokhimii osadochnykh porod, GEOKhI AN SSSR), the age determinations in the Laboratory of Absolute Age Determination (Laboratoriya absolyutnogo vozrasta, VSEGEI). There are 2 figures, 2 tables, and 24 references, 16 of which

TITLE: Experimenting the Calcium Method for the Determination of the Absolute Age of Sylvites (Opyt primeneniya kal'tsiyevogo metoda dlya opredeleniya absolyutnogo vozrasta sil'vinov)

PERIODICAL: Geokhimiya, 1958, Nr 8, pp 718 - 726 (USSR)

ABSTRACT: The possibility of employing the calcium method for age determinations was investigated in this paper. Two samples of white sylvite from stratum "B", Verkhnekamskoye deposit, Berezniki, and one sample from Polovininskaya skvazhina (Irkutskiy amfiteatr) were examined. Calcium was separated from potassium by ion exchangers. For this purpose a new method was developed by the authors and controlled by means of the radioactive isotope Ca^{45} . An apparatus of the type B was used for the measurements. The separated calcium was determined by isotope dilution with Ca^{42} by the aid of the mass spectrometer MS-2m. The Ca^{44}/Ca^{42} - isotope ratio was determined again (Table 4). The resulting age data are given in table 2. For a comparison, the age was also

Card 1/2

Experimenting the Calcium Method for the Determination of SOV/7-58-8-2/8
the Absolute Age of Sylvites

determined by the K/Ar-method. The potassium content was determined by the dipicryl amine method. Argon was measured volumetrically. The isotope analysis of the separated argon was carried through by A. V. Mattes with the mass spectrometer MS-2m. The results are given in table 5, and they are in good agreement with the results of the calcium method provided the investigated sample was not recrystallized (Table 6). The authors thank A. N. Murin and L. M. Krizhanskiy for advice. There are 2 figures, 6 tables, and 14 references, 6 of which are Soviet.

TITLE: Investigating reliability of USEPPA discrete elements

SOURCE: Priborostroyeniye, no. 11, 1966, 25-27

TOPIC TAGS: pneumatic control element, pneumatic control system / USEPPA
pneumatic control system

ABSTRACT: The preliminary results are reported of an investigation of
reliability of USEPPA pneumatic-control elements fabricated by the Ust'-
Kamenogorsk Instrument Plant. Lack of time and continuous modernization of

Card 1/2

UDC: 62.525 "401.7"

ACC NR: AP6036719

elements did not permit conducting a thorough investigation. Tests in "yes-no" circuits were conducted at frequencies up to 2.5 cps (some up to 10 cps), at 25C and 40-70% humidity; the elements were regarded as nonrepairable equipment; supply pressure, 1-4 kg/cm²; twelve different types of elements were tested. The values of the mean time to failure are tabulated. It was found that:

(1) Relay-type elements have a least reliability in the 2.5-5-cps range; (2) The mean time to failure for diaphragm- and shutter-type elements has the same order of magnitude and is practically independent of their circuits; (3) The use of a supply pressure of 1 kg/cm², instead of 1.4 kg/cm², increases the reliability of the elements tenfold; (4) Generally, the failures were caused by wear, and their distribution seems to obey the normal law. Details of tests and hints for modernization are discussed. Orig. art. has: 4 figures, 4 formulas, and 1 table.
